Resuscitate Your MTP Joint Correction from a Dorsal Approach . . .

with the Complete Plantar Plate Repair – CPR
Pigtail Suture Lasso, right (red) and left (lime), come preloaded with a Nitinol loop. The ultra sharp tip and small diameter shaft will easily penetrate soft tissue, while the reinforced shaft resists bending. After the tip is passed through the soft tissue, the loop is deployed and FiberWire® is passed through the plantar plate. Building on years of expertise in upper extremity innovation, these state-of-the-art suture passing techniques have been adapted for the plantar plate repair of the forefoot.

Introducing years of arthroscopic innovation to surgical solutions for the forefoot with our new plantar plate repair system.

Direct repair from a dorsal incision to treat and prevent crossover and floating toe

Reconstruct the soft tissue complex to its anatomic state, eliminating end MP point instability

Grip, pass and retrieve. The Mini Scorpion DX has FastPass technology to automatically retrieve FiberWire, after passing through soft tissue. The instrument works well under direct visualization, as well as "blind" passes through the plantar plate tissue, where access and visualization are often limited.
Pigtail SutureLasso, right (red) and left (lime), come preloaded with a Nitinol loop. The ultra sharp tip and small diameter shaft will easily penetrate soft tissue, while the reinforced shaft resists bending. After the tip is passed through the soft tissue, the loop is deployed and FiberWire® is passed through the plantar plate.

Grasp, pass and retrieve. The Mini Scorpion DX has FastPass technology to automatically retrieve FiberWire, after passing through soft tissue. The instrument works well under direct visualization, as well as "blind" passes through the plantar plate tissue, where access and visualization are often limited.
